[Outline]

You can observe how A, B, and C play rock-paper-scissors.

In one rock-paper-scissors game, which case is more likely to occur, such as when only A wins, when only A loses, or when a tie occurs?

Also, let's find the probability that only A will win, the probability that A will lose, the probability that a tie will occur, the probability that only one will win, and the probability that only one will lose.
